## **Re: Application – Full Stack Engineer (React/Node.js) (Remote)**

I've spent the last six years building backend systems that scale, integrate, and deliver measurable business impact. At Zeitner GmbH, I designed a DATEV-compliant financial reconciliation platform for European e-commerce sellers, reducing manual intervention by 60% and automating workflows across 15+ marketplaces. This experience aligns with your need for a React/Node.js engineer who can own architecture decisions and ship production-ready systems independently.

My technical stack includes Node.js, PostgreSQL, and AWS, with hands-on experience in DevOps tooling and CI/CD pipelines. At Yoobux, I architected an AWS backend that improved throughput by 30% and reduced query latency by 30% through performance optimization. I also built a geo-fencing ad delivery system that cut marketing overhead by 20%. These projects required integrating third-party APIs, optimizing databases, and ensuring high-volume data ingestion pipelines functioned reliably.

As co-founder of BackupSuit, I built a serverless CRM backup platform using AWS Lambda and S3, reducing backup costs by 88% and eliminating manual processes entirely. This experience demonstrates my ability to build end-to-end products from zero to production, balancing technical depth with business outcomes.

I'm particularly drawn to Jobs Ai's focus on scalable, cloud-native solutions. My work at Blackship Studio involved designing BLE communication layers for IoT devices and building ETL pipelines with 90% data consistency. At Chainable Corp, I reduced crash rates by 70% and automated MongoDB ↔ WordPress sync, eliminating 80% of manual management effort.

I'm ready to contribute immediately, with a track record of shipping systems that solve real-world problems. My approach combines startup agility with engineering rigor, and I'm comfortable working in ambiguous environments while maintaining high standards for code quality and performance.

---

Yours sincerely,

**Smit Luvani**
